

Application for Student Assistant in Data, AI and Automation

I am studying MSc Computer Science at DTU and I am very interested in the Student Assistant role in Data, AI and Automation at Boligforeningen AAB. Coming from a software development background in healthcare and finance, I am eager to apply my experience with Python, SQL, and AI tools to help automate administrative processes and generate practical data insights for AAB.

What I have previously used Python for:

In my previous software engineering work and current DTU projects, Python is my primary language. I have used Python to build backend REST APIs (FastAPI/Flask), write automated data extraction and ETL scripts, query relational SQL databases, and develop machine learning models (including PyTorch AI pipelines, retrieval-augmented generation (RAG) systems, and LLM agent tool-calling workflows). Whether it is processing large datasets or automating repetitive tasks, I use Python daily to write clean, reliable code.

I am motivated to join Boligforeningen AAB because you work with real-world operational data to improve housing services in Greater Copenhagen. Working 15 hours a week across 2–3 days fits perfectly alongside my MSc studies at DTU, allowing me to take ownership of automation and data tasks while contributing value to your digitalization team.

You can view my recently done personal and academic projects and CV on my portfolio:
